Standards - Mathematical Practices - Explanations and Examples Fifth Grade

ARIZONA DEPARTMENT OF EDUCATION

HIGH ACADEMIC STANDARDS FOR STUDENTS

State Board Approved June 2010 October2013 Publication

Fifth Grade Overview

Operations and Algebraic Thinking (OA)

- Write and interpret numerical expressions.
- Analyze patterns and relationships.

Number and Operations in Base Ten (NBT)

- Understand the place value system.
- Perform operations with multi-digit whole numbers and with decimals to hundredths.

Number and Operations—Fractions (NF)

- Use equivalent fractions as a strategy to add and subtract fractions.
- Apply and extend previous understandings of multiplication and division to multiply and divide fractions.

Measurement and Data (MD)

- Convert like measurement units within a given measurement system.
- Represent and interpret data.
- Geometric measurement: understand concepts of volume and relate volume to multiplication and to addition.

Geometry (G)

- Graph points on the coordinate plane to solve real-world and mathematical problems.
- Classify two-dimensional figures into categories based on their properties.

Mathematical Practices (MP)

- 1. Make sense of problems and persevere in solving them.
- Reason abstractly and quantitatively.
- Construct viable arguments and critique the reasoning of others.
- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision.
- Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

Fifth Grade: Mathematics Standards - Mathematical Practices - Explanations and Examples

In Grade 5, instructional time should focus on three critical areas: (1) developing fluency with addition and subtraction of fractions, and developing understanding of the multiplication of fractions and of division of fractions in limited cases (unit fractions divided by whole numbers and whole numbers divided by unit fractions); (2) extending division to 2-digit divisors, integrating decimal fractions into the place value system and developing understanding of operations with decimals to hundredths, and developing fluency with whole number and decimal operations; and (3) developing understanding of volume.

- (1) Students apply their understanding of fractions and fraction models to represent the addition and subtraction of fractions with unlike denominators as equivalent calculations with like denominators. They develop fluency in calculating sums and differences of fractions, and make reasonable estimates of them. Students also use the meaning of fractions, of multiplication and division, and the relationship between multiplication and division to understand and explain why the procedures for multiplying and dividing fractions make sense. (Note: this is limited to the case of dividing unit fractions by whole numbers and whole numbers by unit fractions.)
- (2) Students develop understanding of why division procedures work based on the meaning of base-ten numerals and properties of operations. They finalize fluency with multidigit addition, subtraction, multiplication, and division. They apply their understandings of models for decimals, decimal notation, and properties of operations to add and subtract decimals to hundredths. They develop fluency in these computations, and make reasonable estimates of their results. Students use the relationship between decimals and fractions, as well as the relationship between finite decimals and whole numbers (i.e., a finite decimal multiplied by an appropriate power of 10 is a whole number), to understand and explain why the procedures for multiplying and dividing finite decimals make sense. They compute products and quotients of decimals to hundredths efficiently and accurately.
- (3) Students recognize volume as an attribute of three-dimensional space. They understand that volume can be measured by finding the total number of same-size units of volume required to fill the space without gaps or overlaps. They understand that a 1-unit by 1-unit by 1-unit cube is the standard unit for measuring volume. They select appropriate units, strategies, and tools for solving problems that involve estimating and measuring volume. They decompose three-dimensional shapes and find volumes of right rectangular prisms by viewing them as decomposed into layers of arrays of cubes. They measure necessary attributes of shapes in order to determine volumes to solve real world and mathematical problems.

Operations and Algebraic Thinking	g ((OA)
-----------------------------------	-----	------

Write and interpret numerical expressions.
--

Write and interpret numer	ical expressions.		
<u>Standards</u>	Mathematical Practices	Explanations and Examples	
Students are expected to:			
5.OA.A.1. Use parentheses, brackets, or braces in numerical expressions, and evaluate expressions with these symbols. Connection: <i>5.OA.2</i>	5.MP.1. Make sense of problems and persevere in solving them. 5.MP.5, Use appropriate tools strategically. 5.MP.8. Look for and express regularity in repeated reasoning.	the conventional order. Students need experies symbols throughout the year to develop under	rd grade where students are expected to start learning notes with multiple expressions that use grouping standing of when and how to use parentheses, brackets, with whole numbers. Then the symbols can be used as simals and fractions. Answer: 11 Answer: 32 Answer: 11.2
		• $(2+3) \times (1.5-0.5)$ • $6-\left(\frac{1}{2}+\frac{1}{3}\right)$	Answer: 5 1/6
	• {80 ÷ [2 x (3 ½ + 1 ½)]}+100	Answer: 108	
	-	grouping symbols and facility with operations, students he equations true or they compare expressions that are	
		Examples:	
		• 15 - 7 - 2 = 10 → 15 - (7 - 2) = 10	
		• 3 x 125 ÷ 25 + 7 = 22 \rightarrow [3 x (125 ÷ 2	25)] + 7 = 22
		• $24 \div 12 \div 6 \div 2 = 2 \times 9 + 3 \div \frac{1}{2} \Rightarrow 24 \div \frac{1}{2}$	$\div [(12 \div 6) \div 2] = (2 \times 9) + (3 \div \frac{1}{2})$
		• Compare 3 x 2 + 5 and 3 x (2 + 5)	
		• Compare 15 – 6 + 7 and 15 – (6 + 7)	

Operations and Algebraic Thinking (OA)				
Write and interpret numeric	Write and interpret numerical expressions.			
<u>Standards</u>	Mathematical Practices	Explanations and Examples		
Students are expected to:				
5.OA.A.2. Write simple	5.MP.1. Make sense of	Students use their understanding of operations and grouping symbols to write expressions and		
expressions that record	problems and persevere in	interpret the meaning of a numerical expression.		
-	solving them.	Examples:		
example, express the calculation "add 8 and 7, then multiply by 2" as 2 × (8 + 7). Recognize that 3 × (18932 +921) is three times as large as 18932 + 921, without	5.MP.2. Reason abstractly and quantitatively. 5.MP.7. Look for and make use of structure. 5.MP.8. Look for and express regularity in repeated reasoning.	 Students write an expression for calculations given in words such as "divide 144 by 12, and then subtract 7/8." They write (144 ÷ 12) – 7/8. Students recognize that 0.5 x (300 ÷ 15) is ½ of (300 ÷ 15) without calculating the quotient. 		

Operations and Algebraic Thinking (OA)

Analyze patterns and relationships.

	<u> 1athematical Practices</u>	<u>Explanations and Examples</u>
numerical patterns using two given rules. Identify apparent relationships between 5.1	MP.2. Reason abstractly and uantitatively. MP.7. Look for and make use f structure.	 Use the rule "add 3" to write a sequence of numbers. Starting with a 0, students write 0, 3, 6, 9, 12, Use the rule "add 6" to write a sequence of numbers. Starting with 0, students write 0, 6, 12, 18, 24, After comparing these two sequences, the students notice that each term in the second sequence is twice the corresponding terms of the first sequence. One way they justify this is by describing the patterns of the terms. Their justification may include some mathematical notation (See example below). A student may explain that both sequences start with zero and to generate each term of the second sequence he/she added 6, which is twice as much as was added to produce the terms in the first sequence. Students may also use the distributive property to describe the relationship between the two numerical patterns by reasoning that 6 + 6 + 6 = 2 (3 + 3 + 3). 0, 13, 13, 13, 14, 16, 12, 16, 18, 16, 12, 16, 18, 16, 12, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 16, 18, 18, 18, 18, 18, 18, 18, 18, 18, 18

Number and Operations in Base Ten (NBT)			
Understand the place value			
<u>Standards</u>	<u>Mathematical Practices</u>	Explanations and Examples	
5.NBT.A.1. Recognize that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its right and 1/10 of what it represents in the place to its left. Connections: 5.NBT.2; 5.RI.3; 5.W.2d	5.MP.2. Reason abstractly and quantitatively. 5.MP.6. Attend to precision. 5.MP.7. Look for and make use of structure.	In fourth grade, students examined the relationships of the digits in numbers for whole numbers only. This standard extends this understanding to the relationship of decimal fractions. Students use base ten blocks, pictures of base ten blocks, and interactive images of base ten blocks to manipulate and investigate the place value relationships. They use their understanding of unit fractions to compare decimal places and fractional language to describe those comparisons. Before considering the relationship of decimal fractions, students express their understanding that in multi-digit whole numbers, a digit in one place represents 10 times what it represents in the place to its right and 1/10 of what it represents in the place to its left. A student thinks, "I know that in the number 5555, the 5 in the tens place (5555) represents 50 and the 5 in the hundreds place (5555) represents 500. So a 5 in the hundreds place is ten times as much as a 5 in the tens place or a 5 in the tens place is 1/10 of the value of a 5 in the hundreds place." To extend this understanding of place value to their work with decimals, students use a model of one unit; they cut it into 10 equal pieces, shade in, or describe 1/10 of that model using fractional language ("This is 1 out of 10 equal parts. So it is 1/10. I can write this using 1/10 or 0.1."). They repeat the process by finding 1/10 of a 1/10 (e.g., dividing 1/10 into 10 equal parts to arrive at 1/100 or 0.01) and can explain their reasoning, "0.01 is 1/10 of 1/10 thus is 1/100 of the whole unit." In the number 55.55, each digit is 5, but the value of the digits is different because of the placement. 5 5 5 5 5 5 5	

Number and Operations in Base Ten (NBT)

onuci stana the place value system.	U	nderstand	the	place	value	system.
-------------------------------------	---	-----------	-----	-------	-------	---------

Understand the place value	system.	
<u>Standards</u>	Mathematical Practices	Explanations and Examples
Students are expected to:		
5.NBT.A.2. Explain patterns in	5.MP.2. Reason abstractly and	Examples:
the number of zeros of the	quantitatively.	Students might write:
product when multiplying a	5.MP.6. Attend to precision.	
number by powers of 10, and	3.WI .O. Attend to precision.	$36 \times 10 = 36 \times 10^{1} = 360$
explain patterns in the placement of the decimal point	<i>5.MP.7.</i> Look for and make use of structure.	$36 \times 10 \times 10 = 36 \times 10^2 = 3600$
when a decimal is multiplied or		$36 \times 10 \times 10 \times 10 = 36 \times 10^3 = 36,000$
divided by a power of 10. Use whole-number exponents to		$36 \times 10 \times 10 \times 10 \times 10 = 36 \times 10^4 = 360,000$
denote powers of 10.		Students might think and/or say:
Connections: 5.NBT.1; 5.RI.3; 5.W.2b		I noticed that every time I multiplied by 10 I added a zero to the end of the number. That makes sense because each digit's value became 10 times larger. To make a digit 10 times larger, I have to move it one place value to the left.
		When I multiplied 36 by 10, the 30 became 300. The 6 became 60 or the 36 became 360. So I had to add a zero at the end to have the 3 represent 3 one-hundreds (instead of 3 tens) and the 6 represents 6 tens (instead of 6 ones).
		 Students should be able to use the same type of reasoning as above to explain why the following multiplication and division problem by powers of 10 make sense.
		$523 \times 10^3 = 523,000$ The place value of 523 is increased by 3 places.
		$5.223 \times 10^2 = 522.3$ The place value of 5.223 is increased by 2 places.
		$52.3 \div 10^1 = 5.23$ The place value of 52.3 is decreased by one place.

Number and Operations in Base Ten (NBT)

Understand the place value	e system.

Number and Operations in Base Ten (NBT)			
Understand the place value	system.		
<u>Standards</u> Students are expected to:	Mathematical Practices	Explanations and Examples	
5.NBT.A.4. Use place value understanding to round decimals to any place.	5.MP.2. Reason abstractly and quantitatively. 5.MP.6. Attend to precision. 5.MP.7. Look for and make use of structure.	When rounding a decimal to a given place, students may identify the two possible answers, and use their understanding of place value to compare the given number to the possible answers. Example: Round 14.235 to the nearest tenth. Students recognize that the possible answer must be in tenths thus, it is either 14.2 or 14.3. They then identify that 14.235 is closer to 14.2 (14.20) than to 14.3 (14.30).	

Number and Operations in Base Ten (NBT)			
Perform operations with m	ulti-digit whole numbers and	d with decimals to hundredths.	
Standards Students are expected to:	<u>Mathematical Practices</u>	Explanations and Examples	
5.NBT.B.5. Fluently multiply multi-digit whole numbers using the standard algorithm.	5.MP.2. Reason abstractly and quantitatively.5.MP.6. Attend to precision.	In prior grades, students used various strategies to multiply. Students can continue to use these different strategies as long as they are efficient, but must also understand and be able to use the standard algorithm. In applying the standard algorithm, students recognize the importance of place value.	
	5.MP.7. Look for and make use of structure. 5.MP.8. Look for and express regularity in repeated reasoning.	 123 x 34. When students apply the standard algorithm, they, decompose 34 into 30 + 4. Then they multiply 123 by 4, the value of the number in the ones place, and then multiply 123 by 30, the value of the 3 in the tens place, and add the two products. 	

Normalism and Operations in	Daga Tara (NIDT)	
•		d with decimals to hundredths
Number and Operations in Perform operations with machine Standards Students are expected to: 5.NBT.B.6. Find whole-number quotients of whole numbers with up to four-digit dividends and two-digit divisors, using strategies based on place value, the properties of operations, and/or the relationship between multiplication and division. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models. Connection: ETO5-S1C2-O2		In fourth grade, students' experiences with division were limited to dividing by one-digit divisors. This standard extends students' prior experiences with strategies, illustrations, and explanations. When the two-digit divisor is a "familiar" number, a student might decompose the dividend using place value. Examples: • Using expanded notation ~ 2682 ÷ 25 = (2000 + 600 + 80 + 2) ÷ 25 • Using his or her understanding of the relationship between 100 and 25, a student might think: ○ I know that 100 divided by 25 is 4 so 200 divided by 25 is 8 and 2000 divided by 25 is 80. ○ 600 divided by 25 has to be 24. ○ Since 3 x 25 is 75, I know that 80 divided by 25 is 3 with a reminder of 5. (Note that a student might divide into 82 and not 80.) ○ I can't divide 2 by 25 so 2 plus the 5 leaves a remainder of 7. ○ 80 + 24 + 3 = 107. So, the answer is 107 with a remainder of 7. • Using an equation that relates division to multiplication, 25 x n = 2682, a student might estimate the answer to be slightly larger than 100 because she recognizes that 25 x 100 = 2500. • Example: 968 ÷ 21 Using base ten models, a student can represent 962 and use the models to make an array with one dimension of 21. The student continues to make the array until no more groups of 21 can be made. Remainders are not part of the array.
		Continued on next page

Number and Operations in Base Ten (NBT) Perform operations with multi-digit whole numbers and with decimals to hundredths. continued				
Standards Students are expected to:	Mathematical Practices	Explanations and Examples		
5.NBT.B.6. continued		Example: 9984 ÷ 64 • An area model for division is shown below. As the student uses the area model, (s)he keeps		
		track of how much of the 9984 is left to divide.		
		64 64 9984 -6400(100 × 64) 3584 -3200 (50 × 64) 384 50 3200 5 320 1 64 64 -64 (1 × 64)		
5.NBT.B.7. Add, subtract, multiply, and divide decimals to hundredths, using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method and explain the reasoning used. Connections: 5.RI.3; 5.W.2b;	5.MP.2. Reason abstractly and quantitatively. 5.MP.3. Construct viable arguments and critique the reasoning of others. 5.MP.4. Model with mathematics. 5.MP.5. Use appropriate tools strategically. 5.MP.7. Look for and make use of structure.	This standard requires students to extend the models and strategies they developed for whole numbers in grades 1-4 to decimal values. Before students are asked to give exact answers, they should estimate answers based on their understanding of operations and the value of the numbers. Examples: • 3.6 + 1.7 • A student might estimate the sum to be larger than 5 because 3.6 is more than 3 ½ and 1.7 is more than 1 ½. • 5.4 – 0.8 • A student might estimate the answer to be a little more than 4.4 because a number less than 1 is being subtracted. • 6 x 2.4 • A student might estimate an answer between 12 and 18 since 6 x 2 is 12 and 6 x 3 is 18.		
5.W.2c; 5.SL.2; 5.SL.3; ET05-S1C2-02	or structure.	Another student might give an estimate of a little less than 15 because (s)he figures the answer to be very close, but smaller than 6 x 2 ½ and think of 2 ½ groups of 6 as 12 (2 groups of 6) + 3 (½ of a group of 6). Continued on next page		

Standards	Mathematical Practices	and with decimals to hundredths. continued Explanations and Examples
Students are expected to:		
5.NBT.B.7. continued		Students should be able to express that when they add decimals they add tenths to tenths and hundredths to hundredths. So, when they are adding in a vertical format (numbers beneath each other), it is important that they write numbers with the same place value beneath each other. This understanding can be reinforced by connecting addition of decimals to their understanding of additio of fractions. Adding fractions with denominators of 10 and 100 is a standard in fourth grade. Example: • 4 - 0.3 3 tenths subtracted from 4 wholes. The wholes must be divided into tenths. The answer is 3 and 7/10 or 3.7. Example: An area model can be useful for illustrating products. 1.3 2.4 × 1.3 1.2 50 40 + 2.00 3.12 Students should be able to describe the partial products displayed by the area model. For example, "3/10 times 4/10 is 12/100. 3/10 times 4/10 is 4/10 or 40/100. 1 group of 4/10 is 4/10 or 40/100. 1 group of 2 is 2." Example: Finding the number in each group or share • Students should be encouraged to apply a fair sharing model separating decimal values into equal parts such as

		Linear model		
		$ \begin{array}{cccccccccccccccccccccccccccccccccccc$		
		$ \begin{array}{cccccccccccccccccccccccccccccccccccc$		
		$\frac{8}{12}$		
		Solution:		
		$ \begin{array}{cccccccccccccccccccccccccccccccccccc$		
		Examples: Using a bar diagram		
		 Sonia had 2 1/3 candy bars. She promised her brother that she would give him ½ of a candy bar. How much will she have left after she gives her brother the amount she promised? 		
		 If Mary ran 3 miles every week for 4 weeks, she would reach her goal for the month. The first day of the first week she ran 1 ¾ miles. How many miles does she still need to run the first week? 		
		 Using addition to find the answer: 1 ½ + n = 3 A student might add 1 ½ to 1 ½ to get to 3 miles. Then he or she would add 1/6 more. Thus 1 ½ miles + 1/6 of a mile is what Mary needs to run during that week.

Use equivalent fractions as a strategy to add and subtract fractions. continued Standards Students are expected to: Explanations and Examples Fractions are expected to:
Students are expected to:
ENER 2 continued
5.NF.A.2. continued Examples : Using an area model to subtract
 This model shows 1 ¾ subtracted from 3 1/6 leaving 1 + ¼ + 1/6 which a student can then change to 1 + 3/12 + 2/12 = 1 5/12.
$1 1 \frac{1}{4} \frac{1}{6}$ $3^{1}/_{6} \text{ and } 1 \% \text{ can be expressed with a denominator of } 12. \text{ Once this is done a student can complete the problem, } 2 14/12 - 1 9/12 = 1 5/12.$
 This diagram models a way to show how 3 ¹/₆ and 1 ³/₄ can be expressed with a denominato of 12. Once this is accomplished, a student can complete the problem, 2 14/12 − 1 9/12 = 1 5/12.
$\frac{1}{2} \frac{6}{6} = \frac{12}{12} \frac{1}{6} = \frac{2}{12}$
Estimation skills include identifying when estimation is appropriate, determining the level of accurace needed, selecting the appropriate method of estimation, and verifying solutions or determining the reasonableness of situations using various estimation strategies. Estimation strategies for calculation with fractions extend from students' work with whole number operations and can be supported through the use of physical models.

<u>Standards</u>	<u>Mathematical Practices</u>	Explanations and Examples		
Students are expected to:				
5.NF.A.2. continued		Example: • Elli drank $\frac{3}{5}$ quart of milk and Javier drank $\frac{1}{10}$ of a quart less than Ellie. How much milk did they drink all together? Solution: $\frac{3}{5} - \frac{1}{10} = \frac{6}{10} - \frac{1}{10} = \frac{5}{10}$ This is how much milk Javier drank $\frac{3}{5} + \frac{5}{10} = \frac{6}{10} + \frac{5}{10} = \frac{11}{10}$ Together they drank $1\frac{1}{10}$ quarts of milk		
		$\frac{3}{5} + \frac{5}{10} = \frac{6}{10} + \frac{5}{10} = \frac{11}{10}$ Together they drank $1\frac{1}{10}$ quarts of milk This solution is reasonable because Ellie drank more than ½ quart and Javier drank ½ quart so together they drank slightly more than one quart.

b. Find the area of a rectangle with fractional side lengths by tiling it with unit squares of the appropriate unit fraction side lengths, and show that the area is the same as would be found by multiplying the side lengths. Multiply fractional side lengths to find areas of rectangles, and represent fraction products as rectangular areas. Connections:5.RI.3; 5.W.2b; 5.W.2d; 5.SL.1; ET05-S1C4-01; ET05-S1C4-02; ET05-S2C1-01		In solving the problem $\frac{2}{3} \times \frac{4}{5}$, students use an area model to visualize it as a 2 by 4 array of small rectangles each of which has side lengths 1/3 and 1/5. They reason that 1/3 x 1/5 = 1/(3 x 5) by counting squares in the entire rectangle, so the area of the shaded area is $(2 \times 4) \times 1/(3 \times 5) = \frac{2 \times 4}{3 \times 5}$. They can explain that the product is less than $\frac{4}{5}$ because they are finding $\frac{2}{3}$ of $\frac{4}{5}$. They can further estimate that the answer must be between $\frac{2}{5}$ and $\frac{4}{5}$ because $\frac{2}{3}$ of $\frac{4}{5}$ is more than $\frac{1}{2}$ of $\frac{4}{5}$ and less than one group of $\frac{4}{5}$. The area model and the line segments show that the area is the same quantity as the product of the side lengths.

<u>Standards</u>	<u>Mathematical Practices</u>	Explanations and Examples	
5.NF.B.7. Apply and extend previous understandings of division to divide unit fractions by whole numbers and whole numbers by unit fractions. (Students able to multiply fractions in general can develop strategies to divide fractions in general, by reasoning about the relationship between multiplication and division, but division of a fraction by a fraction is not a requirement at this grade.)	5.MP.1. Make sense of problems and persevere in solving them. 5.MP.2. Reason abstractly and quantitatively. 5.MP.3. Construct viable arguments and critique the reasoning of others. 5.MP.4. Model with mathematics. 5.MP.5. Use appropriate tools strategically.	In fifth grade, students experience division problems with whole number divisors and unit fraction dividends (fractions with a numerator of 1) or with unit fraction divisors and whole number dividends. Students extend their understanding of the meaning of fractions, how many unit fractions are in a whole, and their understanding of multiplication and division as involving equal groups or shares and the number of objects in each group/share. In sixth grade, they will use this foundational understanding to divide into and by more complex fractions and develop abstract methods of dividing by fractions. Example: Knowing the number of groups/shares and finding how many/much in each group/share • Four students sitting at a table were given 1/3 of a pan of brownies to share. How much of a pan will each student get if they share the pan of brownies equally? The diagram shows the 1/3 pan divided into 4 equal shares with each share equaling 1/12 of the pan. \$\frac{1}{3}\$	
a. Interpret division of a unit fraction by a non-zero whole number, and compute such quotients. For example, create a story context for $(1/3) \div 4$, and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that $(1/3) \div 4 = 1/12$ because $(1/12) \times 4 = 1/3$.	5.MP.6. Attend to precision. 5.MP.7. Look for and make use of structure. 5.MP.8. Look for and express regularity in repeated reasoning.	Examples: Knowing how many in each group/share and finding how many groups/shares • Angelo has 4 lbs of peanuts. He wants to give each of his friends 1/5 lb. How many friends can receive 1/5 lb of peanuts? A diagram for 4 ÷ 1/5 is shown below. Students explain that since there are five fifths in one whole, there must be 20 fifths in 4 lbs. 1 lb. of peanuts

Geometric measurement: u	Geometric measurement: understand concepts of volume and relate volume to multiplication and to addition.			
Standards Students are expected to:	Mathematical Practices	Explanations and Examples		
 5.MD.C.3. Recognize volume as an attribute of solid figures and understand concepts of volume measurement. a. A cube with side length 1 unit, called a "unit cube," is said to have "one cubic unit" of volume, and can be used to measure volume. b. A solid figure which can be packed without gaps or overlaps using n unit cubes is said to have a volume of n cubic units. Connections: 5.NBT.2; 5.RI.4; 5.W.2d; 5.SL.1c; 5.SL.1d 	5.MP.2. Reason abstractly and quantitatively. 5.MP.4. Model with mathematics. 5.MP.5. Use appropriate tools strategically. 5.MP.6. Attend to precision. 5.MP.7. Look for and make use of structure.	Students' prior experiences with volume were restricted to liquid volume. As students develop their understanding volume they understand that a 1-unit by 1-unit by 1-unit cube is the standard unit for measuring volume. This cube has a length of 1 unit, a width of 1 unit and a height of 1 unit and is called a cubic unit. This cubic unit is written with an exponent of 3 (e.g., in³, m³). Students connect this notation to their understanding of powers of 10 in our place value system. Models of cubic inches, centimeters, cubic feet, etc., are helpful in developing an image of a cubic unit. Student's estimate how many cubic yards would be needed to fill the classroom or how many cubic centimeters would be needed to fill a pencil box.		
5.MD.C.4. Measure volumes by counting unit cubes, using cubic cm, cubic in, cubic ft, and improvised units. Connections: 5.MD.3; 5.Rl.3; ET05-S1C2-02	5.MP.2. Reason abstractly and quantitatively. 5.MP.4. Model with mathematics. 5.MP.5. Use appropriate tools strategically. 5.MP.6. Attend to precision.	Students understand that same sized cubic units are used to measure volume. They select appropriate units to measure volume. For example, they make a distinction between which units are more appropriate for measuring the volume of a gym and the volume of a box of books. They can also improvise a cubic unit using any unit as a length (e.g., the length of their pencil). Students can apply these ideas by filling containers with cubic units (wooden cubes) to find the volume. They may also use drawings or interactive computer software to simulate the same filling process. Technology Connections: http://illuminations.nctm.org/ActivityDetail.aspx?ID=6

Geometry (G) Classify two-dimensional f	figures into categories based	on their properties.
Standards Students are expected to:	Mathematical Practices	Explanations and Examples
5.G.B.4. Classify two-dimensional figures in a hierarchy based on properties. Connections: <i>5.Rl.5</i> ; <i>5.W.2c</i> ; <i>5.W.2d</i> ; <i>5.SL.1</i> ; <i>5.SL.2</i> ; <i>5.SL.3</i> ; <i>5.SL.6</i>	5.MP.2. Reason abstractly and quantitatively. 5.MP.3. Construct viable arguments and critique the reasoning of others. 5.MP.5. Use appropriate tools strategically. 5.MP.6. Attend to precision. 5.MP.7. Look for and make use of structure.	Properties of figure may include: Properties of sides—parallel, perpendicular, congruent, number of sides Properties of angles—types of angles, congruent Examples: A right triangle can be both scalene and isosceles, but not equilateral. A scalene triangle can be right, acute and obtuse. Triangles can be classified by: Angles Right: The triangle has one angle that measures 90°. Acute: The triangle has exactly three angles that measure between 0° and 90°. Obtuse: The triangle has exactly one angle that measures greater than 90° and less than 180°. Sides Equilateral: All sides of the triangle are the same length. Scalene: No sides of the triangle are the same length. Scalene: No sides of the triangle are the same length. polygon quadrilateral triangle parallelogram trapezoid kite scalene isosceles equilateral rectangle rhombus square

Standards for Mathematical Practice (MP)		
Standards Students are expected to:	Mathematical Practices are listed throughout the grade level document in the 2nd column to reflect the need to connect the mathematical practices to mathematical content in instruction.	Explanations and Examples
5.MP.1. Make sense of problems and persevere in solving them.		Students solve problems by applying their understanding of operations with whole numbers, decimals, and fractions including mixed numbers. They solve problems related to volume and measurement conversions. Students seek the meaning of a problem and look for efficient ways to represent and solve it. They may check their thinking by asking themselves, "What is the most efficient way to solve the problem?", "Does this make sense?", and "Can I solve the problem in a different way?".
5.MP.2. Reason abstractly and quantitatively.		Fifth graders should recognize that a number represents a specific quantity. They connect quantities to written symbols and create a logical representation of the problem at hand, considering both the appropriate units involved and the meaning of quantities. They extend this understanding from whole numbers to their work with fractions and decimals. Students write simple expressions that record calculations with numbers and represent or round numbers using place value concepts.
5.MP.3. Construct viable arguments and critique the reasoning of others.		In fifth grade, students may construct arguments using concrete referents, such as objects, pictures, and drawings. They explain calculations based upon models and properties of operations and rules that generate patterns. They demonstrate and explain the relationship between volume and multiplication. They refine their mathematical communication skills as they participate in mathematical discussions involving questions like "How did you get that?" and "Why is that true?" They explain their thinking to others and respond to others' thinking.
5.MP.4. Model with mathematics.		Students experiment with representing problem situations in multiple ways including numbers, words (mathematical language), drawing pictures, using objects, making a chart, list, or graph, creating equations, etc. Students need opportunities to connect the different representations and explain the connections. They should be able to use all of these representations as needed. Fifth graders should evaluate their results in the context of the situation and whether the results make sense. They also evaluate the utility of models to determine which models are most useful and efficient to solve problems.

Standards for Mathematical Practice (MP)			
Standards Students are expected to:	Mathematical Practices are listed throughout the grade level document in the 2nd column to reflect the need to connect the mathematical practices to mathematical content in instruction.	Explanations and Examples	
5.MP.5. Use appropriate tools strategically.		Fifth graders consider the available tools (including estimation) when solving a mathematical problem and decide when certain tools might be helpful. For instance, they may use unit cubes to fill a rectangular prism and then use a ruler to measure the dimensions. They use graph paper to accurately create graphs and solve problems or make predictions from real world data.	
5.MP.6. Attend to precision.		Students continue to refine their mathematical communication skills by using clear and precise language in their discussions with others and in their own reasoning. Students use appropriate terminology when referring to expressions, fractions, geometric figures, and coordinate grids. They are careful about specifying units of measure and state the meaning of the symbols they choose. For instance, when figuring out the volume of a rectangular prism they record their answers in cubic units.	
5.MP.7. Look for and make use of structure.		In fifth grade, students look closely to discover a pattern or structure. For instance, students use properties of operations as strategies to add, subtract, multiply and divide with whole numbers, fractions, and decimals. They examine numerical patterns and relate them to a rule or a graphical representation.	
5.MP.8. Look for and express regularity in repeated reasoning.		Fifth graders use repeated reasoning to understand algorithms and make generalizations about patterns. Students connect place value and their prior work with operations to understand algorithms to fluently multiply multi-digit numbers and perform all operations with decimals to hundredths. Students explore operations with fractions with visual models and begin to formulate generalizations.
